

Item Code Generator Web Form Development Plan

1. Project Objective

Create a web form system for on-site staff to input new product data. The system will automatically calculate the **Item Code**, **Item Name**, **GL Account**, and other technical details (weight/unit) to reduce errors and enable immediate integration into NetSuite.

2. Web Form Structure (User Interface)

The web page is divided into 2 main sections:

Section 1: Manual Input by User

Field	Input Type	Notes
Type	Dropdown	Parent / Child
Item Group	Dropdown	
Item Sub-Group	Dropdown	e.g., GK, GC, CK, CZ
Domestic/Export	Dropdown	E, D, M
Brand	Dropdown	e.g., Double A, Smartist
Gram (GSM)	Text Input	3-digit number
Size	Text Input	
Sheet	Text Input	
Layer	Dropdown	e.g., 16L, 17L
Wrap Type	Dropdown	e.g., Box MN, Box AUTO
Pallet Type	Dropdown	
REAM / BOX	Dropdown	1R, 2R, 3R, 4R, 8R, CVB / 5R, 10R, 10P, 24P
Pallet Size	Dropdown	
Location for Work Order	Dropdown	
Item Category	Dropdown	
Grade	Dropdown	
Ream per Pallet	Number Input	

Section 2: Automated Calculation Display

Fields automatically calculated and displayed to the user before saving:

Field	Description
Item Code	Calculated from concatenating base data + Running Number
Item Name	Calculated according to new 100% logic
UOM & Weight	Displays sales unit and weight pulled from Master Size
Alert Message	Warning if duplicate Item Code is found in the List sheet

3. Key Logic & Calculation

3.1 Item Name Construction

The system combines text in the following order:

1. **Brand**
2. **Gram&G + Size + (Sheet)**
3. **Wrap Type** (*only for Sub-Group: Cutsite, Small pack*)
4. **Layer**
5. **REAM / BOX** (*displayed only for Extra group: 1R, 2R, 3R, 4R, 8R, CVB*)
6. **Ream per Pallet + RP Code** (*if 500 = R/P, others = PAC/P*)
7. **Pallet Type**
8. **FSC Suffix** (*display "FSC MIX70%" when paper grade conditions are met*)
9. **Pallet Size Suffix** (*if Pallet Size contains DIY → add "T", if contains EU/EURO → add "E"*)

3.2 Item Code Construction

Format: [Item Group][Sub-Group][Dom/Exp] - [Brand] - [Gram] - [Size] - [Sheet] - [Layer] - [Running No.]

- **Running No.:** The system performs a VLOOKUP in the List sheet to find the latest number for that group, then increments it.

3.3 Weight & UOM Calculation

Calculation	Description
Standard/Net Weight	Pull Weight/Ream or Weight/Pack from the Size sheet, based on Size, Gram, and Sheet
Special Condition	If Ream per Pallet is 0 or empty, use 5 as the default multiplier
Primary Sale Unit	Export → Carton; Sheet = 500 → Ream; Others → Not sure

4. Data Sources

Source Sheet	Purpose
List (<i>NetSuite - Add Item CZ 2 - List</i>)	Check for duplicate item codes, running number generation, and GL account mapping
Size (<i>NetSuite - Add Item CZ 3 - Size</i>)	Pull technical data such as weight per ream and height per layer

5. Testing Plan

Test Type	Description
Validation Test	Verify that all 8 dropdown fields can be selected correctly and completely
Logic Test	Input REAM / BOX as 5R and verify it does not appear in Item Name
Calculation Test	Leave Ream per Pallet blank and verify the system uses 5 for weight calculation
Duplicate Test	Attempt to create an existing code from the List sheet and verify the Alert warning works
